## THE ALABAMA COMMUNITY HEALTH RESOURCE GUIDE

A comprehensive community resource guide for health professionals and grassroots organizations as they create their "health care story" for funders, stakeholders and policymakers.

Alabama Department of Public Health Office of Primary Care and Rural Health, National Organization of State Offices of Rural Health and the Alabama Rural Health Association

## The Alabama Community Health Resource Guide

A comprehensive community resource guide for health professionals and grassroots organizations as they create their "health care story" for funders, stakeholders and policymakers

Access and availability to health care in rural and underserved areas of Alabama is an issue of vital importance to the economic viability of a community. Quality of life issues as well as the ability to attract employers depends on a strong community education and health care system.

This guide was developed in collaboration with the Alabama Rural Health Association, the Alabama Office of Primary Care and Rural Health and the National Organization of State Offices of Rural Health to help communities:

- identify local and regional health status issues;
- integrate issues of rural health care into economic development and community planning;
- assist communities with grant writing; and
- provide baseline health data for evaluation of community programs.

This guide is divided into four sections:
Section 1: Unique Alabama factors affecting the health care delivery system
Section 2: Tips on presenting health data
Section 3: Data Report Examples—Presentation of County Data and Health Status Indicator Report: Motor Vehicle Accident Fatality

Section 4: Resources for finding health-related data

General Health Status of Alabama's Rural Residents Compares Unfavorably to Urban Residents ..... 19

## Rural Areas are Experiencing Greater Population Growth

The Office of Primary Care and Rural Health in Alabama regards 55 of Alabama's 67 counties as rural. Between 1910 and 2000, the rural counties experienced a meager 38 percent increase in population while the 12 urban counties increased by 246 percent. Twenty-six of the 55 rural counties actually experienced a decrease in population between 1910 and 2000 with five counties (Bullock, Greene, Lowndes, Perry, and Wilcox) losing nearly two-thirds of their population during that period. This lack of population growth in Alabama's rural counties can be attributed to the outward migration of the African American population and the mechanization of agriculture.

Figure 2
Percent Population Change Selected Areas, 2000-2025

SOURCE: Alabama State Data Center, The University of Alabama and the U.S. Census Bureau.

Starting in the 1990's this trend began to change. Alabama's rural counties are currently growing at a greater rate than the urban counties. This growth is greatest in the counties bordering major urban areas. Figure 2 presents projected population change between 2000 and 2025 showing the greater growth in rural counties. Within these rural counties, incorporated areas are growing more rapidly than unincorporated areas.

These changing trends in Alabama's population are placing greater demands on rural health care providers including an emergency medical system which may not be adequately staffed.

## Rural Areas Have an Older Population

According to the Alabama State Data Center's 2006 population estimates, the elderly (age 65 years or older) comprised 14.5 percent of Alabama's rural county population compared to only 12.5 percent in the urban counties. This difference is projected to become even greater. Between 2000 and 2025, the elderly population is projected to increase by 79.6 percent in Alabama's rural counties compared to a 66.0 percent increase in the urban counties. This can be seen in Figure 3.

Figure 3
Percent Change in Elderly (Age 65+) Population
Selected Areas, 2000-2025

SOURCE: Alabama State Data Center, The University of Alabama and the U.S. Census Bureau.

This dramatic increase in the elderly population will seriously challenge Alabama's rural health care industry. Using the National Ambulatory Medical Care Survey, it is estimated that there will be more than 904,000 additional annual office visits to primary care physicians in Alabama by 2025. This increase in primary care visits is primarily due to the aging population. Additional visits may be needed due to the growing trends in diabetes and obesity in rural populations.

## Alabama's Rural Population Has Less Formal Education

There is a strong relationship between educational attainment and health status. According to the 2000 Census of Population, nearly one-third (30.3\%) of all rural Alabama residents age 25 years or older had less than a high school education. This exceeds the 20.2 percent of urban residents in this age group with less than a high school education. This can be seen in Figure 4. A strong educational system producing well educated rural residents is vital to improving the long-term health status of Alabama's rural residents, reversing the economic struggles of rural Alabama, and providing rural students with the educational opportunities that are needed for them to compete with their urban counterparts for opportunities such as admission to medical school.

Figure 4
Percent Population Age 25+ With Less Than A High School Education Selected Areas, 2000

SOURCE: U.S. Census Bureau.

## Alabama's Rural Population Reflects Greater Ethnic Diversity

Alabama's rural population has greater ethnic diversity primarily due to the relatively sudden increase in the Hispanic/Latino population. Alabama's Hispanic/Latino population increased nearly 208 percent between the 1990 and 2000 Censuses. This represents the seventh greatest increase in this population among all 50 states. This tremendous growth is continuing.

According to estimates developed by the Alabama State Data Center at the University of Alabama, Alabama's rural Hispanic/Latino population increased 502.9 percent between 1990 and 2006. This greatly exceeds the estimated 279.9 percent increase in urban counties and the 98.3 percent increase nationally. Figure 5 illustrates this trend. There is general agreement that estimates of the Hispanic/Latino population are likely to be understated.

Figure 5
Percentage Increase in the Hispanic/Latino Population Selected Areas, 1990-2006

SOURCE: Alabama State Data Center (http://cber.cba.ua.edu/asdc.html) and the U.S. Census Bureau.

This sudden increase in Alabama's Hispanic/Latino population has posed challenges in counties where this growth has been the greatest. The presence of a language barrier in many instances makes the services of an interpreter necessary. There is a lack of knowledge and experience with regard to cultural differences in providing health care to persons of Hispanic/Latino ethnicity. There have also been financial challenges in some areas where Alabama's new Hispanic/Latino population is uninsured.

Another source which can be used to indicate the growth in Alabama's Hispanic/Latino population is data on births. This source is considered to be more complete since all babies born within the United States are citizens of this country, regardless of the residence of the parents.

Figure 6 below presents the percentage of all births to Alabama residents of Hispanic/Latino ethnicity, illustrating the relatively sudden and tremendous growth in this population. In 1992, only 0.7 percent of all births to Alabama residents were Hispanic/Latino. By 2006, this percentage steadily increased to 7.5 percent. Figure 7 below presents these percentages by the mother's county of residence for 2006 births. Five Alabama counties had 20 percent or more of all births to residents of Hispanic/Latino ethnicity. All five of these counties are rural.

Percent Hispanic Births in Counties
Exceeding the State Percentage (7.5\%), 2006

[^1]
## Alabama's Rural Population is Not as Wealthy

There is a strong relationship between personal wealth and health status. Medicaid has been referred to as "Rural Alabama's Health Insurance." There is a strong justification for this statement considering 23.3 percent or nearly one in every four rural residents is eligible for Medicaid benefits. This compares to 19.4 percent for urban county residents. In addition, 45.9 percent of all rural children under age 21 are eligible for Medicaid benefits compared to 35.2 percent for urban children. Unfortunately, many rural Alabama primary care physicians are electing not to provide service to Medicaid patients for various reasons. This greatly increases the importance of rural safety net providers. Figures 8 and 9 illustrate rural Alabama's reliance on Medicaid for health care.

Figure 8
Medicaid Eligible Population
Selected Areas, 2006

SOURCE: Alabama Medicaid Agency.

Figure 9
Medicaid Eligible Children
Selected Areas, 2006

[^2]Per capita personal income is the average earned income per person based on the income generated by his or her community or state. According to 2007 per capita personal income figures recently released by the U. S. Bureau of Economic Analysis, the income per person for rural Alabama residents is $\$ 26,646$ which is over 28 percent lower than the per capita income of $\$ 34,182$ for urban residents and nearly 38 percent below the national figure of $\$ 36,714$. The 31 Alabama counties with the lowest per capita income levels are all rural. Three rural Alabama counties (Bullock, Macon, and Wilcox) are among the 250 poorest counties in the nation. Figure 10 illustrates the significant disparity in per capita personal income.

Figure 10
Per Capita Personal Income
Selected Areas, 2006

SOURCE: U.S. Bureau of Economic Analysis.

The great presence of poverty in Alabama's rural counties naturally results in more indigent care being provided by rural hospitals. This makes attracting new patients with health insurance more important to the economic viability of these rural hospitals.

## Alabama's Rural Population Has More Restricted Access to Health Care

A task force assembled by former Governor Jim Folsom, Jr. concluded that the greatest problem impacting access to rural health care was transportation. The availability of public transportation varies greatly among Alabama's rural counties and even within counties. Transportation poses two different concerns for Alabama's rural health care industry. First, there is a large portion of the rural population which does not have a reliable means of transportation to health care providers. Figure 11 shows that 8.5 percent of all households in Alabama's rural counties did not have a vehicle in 2000. And 30.3 percent of all rural households had only one vehicle.

Figure 11
Percentage Households With No Automobile Selected Areas, 2000

SOURCE: U.S. Bureau of the Census (www.census.gov).

Second, the portion of the rural population which has adequate transportation tends to include more persons with health insurance. Unfortunately, many of these potential patients commute greater distances to seek health care from urban providers rather than utilizing the health care providers in their rural communities.

While the lack of adequate transportation poses a serious concern for many rural residents, the lack of primary care practitioners and the aging of the current primary care physician workforce pose serious barriers to access for all rural residents. The Health Professional Shortage Area designation methodology developed by the U. S. Department of Health and Human Services, Health Resources and Services Administration (HRSA) is the most widely recognized method for identifying primary care, dental, and mental health professional shortages. According to this methodology, 54 of Alabama's 55 rural counties are currently classified as having a shortage of primary care physicians providing service to either the entire population or the low-income population.

This methodology only measures what is considered to be the minimal level of service that is needed to serve a population rather than the level of service that is desirable. According to this methodology, Alabama currently needs an additional 132 strategically placed primary care physicians to eliminate all shortages. HRSA estimates that Alabama needs 474 strategically placed primary care physicians to provide a desirable level of service. Figure 12 illustrates the lack of primary care physician service in rural counties. The 4.6 primary care physicians per 10,000 population in rural counties is just above one half of the 8.0 per 10,000 population in the urban counties.

Figure 12
Primary Care Physicians Per 10,000 Population
Selected Areas, 2006

SOURCE: Medical Licensure Commission 2006 Licensed Physician Data Base and the U.S. Bureau of Labor Statistics.

As serious as these figures on the primary care physician shortage may appear, the shortage crisis is actually more serious. These figures do not include such concerns as

- the aging of the primary care physician workforce
- the decreasing trend for medical students to elect rural primary care practice
- the aging of Alabama's population and the increasing need for primary care that this will bring
- the dramatic increase in population characteristics such as obesity.

These factors are certain to create greater demands for primary care services.
Figure 13 provides an alarming illustration of Alabama's actively practicing primary care physician workforce consisting of 3,048 in 2006. By 2011, more than one-half of these physicians will be over 55 years of age. The smaller numbers of physicians in the younger age groups reflect the decrease in the number of medical school graduates who are selecting primary care as a medical practice focus.

Figure 13
Primary Care Physicians Actively Practicing In Alabama by Age, 2006

Source: Alabama Medical Licensure Commission Licensed Physician Database.
At the same time that our primary care physician workforce is aging, Alabama's population is getting older and more vulnerable to chronic disease. According to the Centers for Disease Control and Prevention's 2007 Behavioral Risk Factor Surveillance System, 30.9 percent of all Alabamians are obese, not simply overweight. This is the second highest percentage among all 50 states and this percentage is increasing each year. This and other unhealthy conditions are certain to require additional primary care physician services.

The shortage of actively practicing dentists is even more critical in rural Alabama. HRSA estimates that Alabama currently needs an additional 294 strategically placed dentists to eliminate all shortages. Alabama's only dental school admits only 55 students each year. By 2011, with the aging of Alabama's dental workforce, it is expected that more than 55 dentists will be retiring from practice each year. Rural Alabama is in danger of having several counties with no dental practice. Figure 14 presents the number of dentists per 10,000 population. Not considered in this figure are

- the ages of Alabama's dental workforce
- the amount of time each dentist practices
- how many dentists serve the uninsured or underinsured population

Figure 14
Dentists Per 10,000 Population
Selected Areas, 2003

SOURCE: Board of Dental Examiners, 2003 Licensed Dentist Data Base and the U.S. Bureau of Labor Statistics.

Perhaps no practitioner shortage is greater than that for mental health care professionals. Professional counselors and psychologists are not allowed to write prescriptions under Alabama law. Only psychiatrists are licensed to prescribe medications. Most rural Alabama counties only have the services of a visiting psychiatrist for a few hours per week at the local outpatient mental health center. Many rural hospital emergency rooms do not have staffing that is adequately trained in handling drug abuse and psychiatric cases. Figure 15 illustrates the number of actively practicing psychiatrists per 10,000 population. Figure 16 on the next page shows the higher suicide mortality rate among rural Alabamians.

Figure 15
Psychiatrists Per 10,000 Population
Selected Areas, 2006

[^3]Figure 16
Suicide Deaths Per 100,000 Population
Selected Areas, 2003-2005

SOURCE: Center for Health Statistics, Alabama Department of Public Health and Centers for Disease Control and Prevention.

Nearly one-quarter of all rural Alabamians only have Medicaid coverage. It is estimated that 12 percent of all rural residents are uninsured, while 10.6 percent of Alabama's urban residents are uninsured. See Figure 17.

Figure 17
Percent Uninsured Population
Selected Areas, 2003

SOURCE: Alabama County Chartbook, State Health Access Data Assistance Center, University of Minnesota, July 2005.

The greater prevalence of disability among rural residents creates another barrier to access to primary care. According to 2000 Census data, 25 percent of all rural Alabamians age 65 years or older had a disability that prevented them from going outside of their residence. This compares to 23.1 percent in Alabama's urban counties and 19.4 percent nationally. This can be seen in Figure 18. This greater presence of disability among rural residents is also supported by 2006 Medicare disability data indicating that 4.5 percent of all rural Alabama residents were receiving Medicare disability compared to 3.4 percent for urban residents and only 2.2 percent nationally. This can be seen in Figure 19.

## Adequate Emergency Medical Services are Not a Certainty in All Rural Areas

The presence of adequate and quality health care, including emergency medical services, is of extreme importance in attracting economic development.

The ability of local emergency medical service to respond quickly in arriving at the accident scene, stabilizing conditions, and transporting the victim to qualified emergency care is critical. Following an accident there is a "golden hour" in which the victim's likelihood of survival is greater. Access to EMS services is critical during this "golden hour."

Figures 21-23 present mortality rates from all accidents: motor vehicle accidents; drowning and submersion; and exposure to smoke, fire, and flames. The mortality rate from motor vehicle accidents for Alabama's rural residents of 32.0 deaths per 100,000 persons exceeds the urban rate of 20.7 and is more than double the national rate of 15.3.

Disturbingly similar rates are seen for drowning and submersion deaths and mortality due to exposure to smoke, fire, and flames. While well staffed, well trained, and adequately funded emergency medical service would decrease death rates for these two types of accidents, better education and preparedness may provide a greater impact.

## General Health Status of Alabama's Rural Residents Compares Unfavorably to Urban Residents

One of the most widely recognized indicators of health status, life expectancy, clearly shows the disparity between the overall health status of rural Alabamians compared to their urban counterparts. A rural resident born today is expected to have a lifetime that is more than six months shorter than an urban resident born today -74.4 years compared to 75.1 years. The disparity is even greater when compared to national life expectancy. Nationally, a person born today is expected to live 3.5 years longer than a rural Alabamian. These disparities can be seen in Figure 32.

Figure 32
Life Expectancy at Birth
Selected Areas, 2005

SOURCE: Center for Health Statistics, Alabama Department of Public Health and Centers for Disease Control and Prevention.

The reasons for the life expectancy disparity between Alabama's rural and urban residents are quite diverse. An analysis of the causes of death among rural Alabamians clearly reveals the diversity of environmental, behavioral, and other differences. Higher mortality rates from suicide and accidents (especially motor vehicle accidents, drowning, and fires) have already been described. In addition, mortality or death rates for heart diseases, Alabama's leading cause of death since 1924, are significantly higher among rural residents. During 2003-2005, Alabama's rural residents experienced a mortality rate of 330.6 deaths per 100,000 persons each year compared to only 250.0 for urban residents and 230.1 for the nation. The rural-urban disparity was greatest for heart failure and ischemic heart disease. These disparities can be seen in Figures 34-35.

Figure 34
Heart Failure Deaths Per 100,000 Population
Selected Areas, 2003-2005

SOURCE: Center for Health Statistics, Alabama Department of Public Health and Centers for Disease Control and Prevention.

Figure 35
Ischemic Heart Disease Deaths Per 100,000 Population Selected Areas, 2003-2005

SOURCE: Center for Health Statistics, Alabama Department of Public Health and Centers for Disease Control and Prevention.

Cancer mortality is also greater among rural Alabamians. During 2003-2005, the mortality rate for deaths due to cancer was 230.9 deaths per 100,000 population each year for Alabama's rural residents compared to 205.9 for urban county residents and 188.6 for the nation. This can be seen in Figure 36. The rural mortality rate for cancer of the trachea, bronchus and lung is 75.3 deaths per 100,000 population compared to 63.2 for urban residents and 53.8 for the nation. This can be seen in Figure 37.

Figure 36

Figure 37
Cancer of the Trachea, Bronchus, and Lung Deaths Per 100,000 Population Selected Areas, 2003-2005

SOURCE: Center for Health Statistics, Alabama Department of Public Health and Centers for Disease Control and Prevention.

Other cancers that have higher mortality rates among rural Alabama residents include the following: colon, rectum, and anus; breast; cervix uteri; ovary; prostate; and meninges, brain, and other parts of the central nervous system.

Other major causes of death for which the rural-urban disparity is greater include Alzheimer's disease, cerebrovascular diseases (stroke), chronic lower respiratory diseases, diabetes, pneumonia, and septicemia (blood poisoning). Figures 38-43 illustrate these disparities.

The data reflected in this section provides information on unique factors affecting Alabama's rural health care delivery system. We have highlighted what we felt were the major health indicators that demonstrate the need for expanded access and availability of health care services in rural communities. However, much more information is available.

In section 4, we provide you with resources to find additional health data.

## SECTION 2:

## Tips on presenting health data

Health data is used to demonstrate a need, define a problem or concern or inform stakeholders about risky behaviors. In this section, the recommended tips on presenting health data can impact how your audience reacts. This section is recommended for individuals and agencies who are preparing grants or presentations including health-related data.
Express Your Data Using Accepted Conventions ..... 26
Beware of Small Numbers of Events ..... 27
Does Your Finding Make Sense? ..... 28
Make Your Presentation of Data a Work of Art ..... 28
Trends Over Time Can Be High Impact for Certain Events ..... 28
Rankings Can Be High Impact Even When the Number of Events is Not Great. ..... 29
Comparing the Number of Events to Something Else Can Impress the Reader ..... 30

## Express Your Data Using Accepted Conventions

The key to using data and statistics is to make it understandable. Analysts and statisticians express data using certain accepted conventions. For example, certain data is expressed for every 100 persons while other data is expressed for every 100,000 persons.

If unemployment rates are being considered, the accepted convention is to identify the number of unemployed persons per every 100 persons who are available to be employed. However, rates for specific causes of death (cancer mortality rate for example) are expressed per 100,000 persons. Birth rates are expressed per 1,000 persons. Infant mortality rates are expressed per 1,000 births.

Before you calculate percentages, rates, ratios, etc. look at publications that present the same type of data that you are working with to see if there is an accepted and conventional way that this data is normally presented.

It is confusing to many users when an event is reported based on a population that is greater than the population of the area being studied. For example, cause-specific mortality rates are calculated per 100,000 population. Most Alabama counties do not have populations of 100,000 or more. Why would a rate be calculated per 100,000 population for areas with less than 100,000 population? This is a way of removing population differences in your rate calculation.

Consider Example 1 below. In 2005, there were 131 motor vehicle fatalities involving Jefferson County residents and 22 involving Marshall County residents. Simply reporting the number of events (fatalities) could lead some readers to think there is a more serious problem in Jefferson County, especially if they are not aware of the difference in the populations of the two counties. By calculating a rate for the motor vehicle fatalities per 100,000 population, the difference in the populations of the two counties is removed and it can be seen that there is actually a greater occurrence of motor vehicle fatalities in Marshall County.

## Example 1

> 131 motor vehicle fatalities involving Jefferson County residents in 2005. 22 motor vehicle fatalities involving Marshall County residents in 2005. The 2005 estimated population of Jefferson County is 659,777 . The 2005 estimated population of Marshall County is 86,422 .
> Calculation of Cause-Specific Mortality rates for both counties:
> Jefferson County $-(131 \div 659,777) \times 100,000=19.9$
> Marshall County $-(22 \div 86,422) \times 100,000=25.5$

This example also shows why 100,000 is used. If the rate had been based on 1,000 population rather than 100,000 the rates would have been 0.199 for Jefferson County and 0.255 for Marshall County. For many people, larger numbers are easier to compare and visualize differences between than are fractional numbers.

## Beware of Small Numbers of Events

Small numbers of events can give misleading results. In order for data to be statistically valid, at least 16 occurrences of the event are required. Any data analysis with fewer than 16 events should have a footnote indicating that the findings may not be statistically sound.

If you simply want to report the number of events (the number of new tuberculosis cases in a county for example) you may not need to calculate a rate, percentage, etc. The mere occurrence of the event may be all that you want to inform your audience about. If you are comparing that number to the number in another area or areas, you may want to include rates to remove possible distortion from differences in population sizes.

If you do want to calculate a rate, percentage, etc. to get the severity of the issue across to your audience, you can report data for more than one year (or other time period) to increase the number of events and improve the validity of the data. For example, you may want to calculate three-year infant mortality rates for counties since the numbers of such deaths in some counties will be quite small and a change of only one or two deaths in any year could produce a large and potentially misleading change in a rate. However, try to avoid combining so many years (or other time periods) that you fail to reveal real changes in longterm trends. As a general rule, rates should not be calculated for more than a five-year period of time.

Consider Example 2 below. You want to compare current infant mortality data for DeKalb County to the state. You will need to calculate a rate to remove distortion produced by the great difference in population for the county in relation to the entire state. In 2006 there were seven infant deaths to residents of DeKalb County. This is a small number, and a change in the number of deaths by only one or two could alter your entire outcome. By calculating a three-year rate for 2004-2006, you increase the number of deaths to 28 and remove the potential of small number distortion.

Example 2
Alabama Infant Deaths: $2006=569,2005=561,2004=516 ; 2004-2006=1,646$
DeKalb County Infant Deaths: $2006=7,2005=9,2004=12 ; 2004-2006=28$
Alabama Births: $2006=62,915,2005=60,262,2004=59,173 ; 2004-2006=182,347$
DeKalb County Births: 2006 = 996, 2005 = 953, 2004 = 1,013; 2004-2006 = 2,962
Calculation of 2004-2006 Infant Mortality Rates for both areas:
Alabama - $(1,646 \div 182,347) \times 1,000=9.0$
DeKalb County $-(28 \div 2,962) \times 1,000=9.5$

## Does Your Finding Make Sense?

Perhaps the greatest single talent that is needed in analyzing and presenting data is common sense. Always ask yourself whether your findings make sense. If something looks questionable or unbelievable, it may be an error. Never assume that your data cannot be incorrect, especially if you obtained the data through an interactive program. It is easy to accidentally specify an incorrect parameter or misunderstand the interactive instructions. Being interested in your data and your findings and looking closely for unexpected outcomes is perhaps the best way to find possible errors. Another way to prevent such a devastating occurrence as publishing incorrect findings is to have someone review your work critically prior to it being released.

## Make Your Presentation of Data a Work of Art

How you present your data is determined by the data findings and the target audience. Your presentation of data may be better understood by your audience in terms of charts, graphs and tables. Think of your data presentation as a work of art.

## Trends Over Time Can Be High Impact for Certain Events

If you are looking at a subject that is changing greatly over time, presenting a graphic that paints a picture of this change can highly impact your message. Such an example is the rapid growth in Alabama's Hispanic/Latino population. This would even be more impressive for selected counties such as Bullock, DeKalb, Franklin, Jefferson, and Marshall.

Example 3 presents the percentage of all Alabama resident births to Hispanic/Latino women during each year from 1992 through 2006. This graphic makes the suddenness and magnitude of this population growth highly visible to the reader. It is a recognized fact that census population figures for the Hispanic/Latino population are undercounted. However, since babies born in the United States are U. S. residents at birth, even if one or both parents are undocumented, this data is certain to be more accurate.

Example 3
Percent Births of Hispanic Origin
Alabama Residents, 1992-2006

NOTE: Data is provided by the Alabama Department of Public Health, Center for Health Statistics.

## Rankings Can Be High Impact Even When the Number of Events is Not Great

People understand and tend to have a stronger reaction to rankings. Rankings can be a highly effective presentation tool for getting your message across even when the number of events may not appear to be great.

An example of effective ranking is presenting in Example 4, mortality due to smoke, fire, and flames. Using the data source "CDC Wonder" that is described in this publication, Alabama lost 320 residents due to smoke, fire, and flames during 2003-2005. This produced a mortality rate of 2.4 deaths per year, per 100,000 population. At first glance, this does not appear to be a great concern since there were only 320 deaths over three years in a state with approximately 4.5 million people.

Since merely presenting the number of deaths and/or rate may not reveal the seriousness of this devastating health hazard to your audience and get the reaction that you want, you may want to present your data in a different way. Comparing deaths from smoke, fire, and flames in Alabama to all other states reveals the fact that Alabama tied for having the second highest death rate among all 50 states. This reveals a much clearer picture of the seriousness of this type of accident in Alabama and your audience will now view the 320 deaths and this seemingly low rate differently.

Example 4
States With The Highest
Smoke, Fire, and Flames Mortality Rates
United States, 2003-2005

[^4]
## Comparing the Number of Events to Something Else Can Impress the Reader

Comparing the number of events occurring over a specified time period to something else that your audience can envision can be a powerful statistical tool for getting your message across and generating the desired concern and reaction. For example, approximately 9,800 Alabamians die each year from malignant cancers. While this number is impressive, it could be even more impressive to inform your audience that 9,800 is approximately the same as the total current population of Greene County - all ages, all races, all genders, everyone living in the county.

## Example 5

The number of Alabamians dying from cancer each year (approximately 9,800 ) is about the same as the total current population of Greene County.

Alabama has only 67 counties. Making the reader aware of the fact that every year the equivalent of the total population of one of Alabama's counties is lost to cancer presents that number in a different and more powerful way.

This message could be presented using other comparisons. There were 29,358 Alabama residents who died from cancer during 2004-2006. This number actually exceeds the combined total populations of Choctaw and Sumter counties or Clay and Cleburne counties.

Use your artistic skills and innovation in presenting data to more effectively reach your audience and generate the desired reaction. After all, it really is not just about the data but how you tell the story using the data.

## SECTION 3:

## Data Report Examples

Section 3 includes a comprehensive Alabama county health data report and an example of a health status indicator report focusing on motor vehicle accidents.

Other health status indicator reports can be found on our website at www.adph.org/ruralhealth.

In addition, if you have a special interest in a topic, please contact our office at (334) 2065436. The State Office of Rural Health offers data support and technical assistance on rural health issues.

## Counties in Various Regions or Classifications of Alabama

North Alabama Action Commission includes Colbert, Cullman, DeKalb, Franklin, Jackson, Lauderdale, Lawrence, Limestone, Madison, Marion, Marshall, Morgan, and Winston.

West Alabama Action Commission includes Bibb, Fayette, Greene, Hale, Lamar, Pickens, and Tuscaloosa.

Central Alabama Action Commission includes Blount, Chilton, Jefferson, St. Clair, Shelby, and Walker.

East Alabama Action Commission includes Calhoun, Chambers, Cherokee, Clay, Cleburne, Coosa, Etowah,
Randolph, Talladega, and Tallapoosa.
South Central Alabama Action Commission includes Autauga, Bullock, Butler, Crenshaw, Elmore, Lee, Lowndes, Macon, Montgomery, Pike, and Russell.

Tombigbee Action Commission includes Choctaw, Clarke, Conecuh, Dallas, Marengo, Monroe, Perry, Sumter, Washington, and Wilcox.

Wiregrass Action Commission includes Barbour, Coffee, Covington, Dale, Geneva, Henry, and Houston.
Southwest Alabama Action Commission includes Baldwin, Escambia, and Mobile.

Black Belt Action Commission includes Bullock, Choctaw, Dallas, Greene, Hale, Lowndes, Macon, Marengo,
Perry, Pickens, Sumter, and Wilcox counties.
Rural Counties include Autauga, Baldwin, Barbour, Bibb, Blount, Bullock, Butler, Chambers, Cherokee, Chilton, Choctaw, Clarke, Clay, Cleburne, Coffee, Colbert, Conecuh, Coosa, Covington, Crenshaw, Cullman, Dale, Dallas, DeKalb, Elmore, Escambia, Fayette, Franklin, Geneva, Greene, Hale, Henry, Jackson, Lamar, Lawrence, Limestone, Lowndes, Macon, Marengo, Marion, Marshall, Monroe, Perry, Pickens, Pike, Randolph, Russell, St. Clair, Sumter, Talladega, Tallapoosa, Walker, Washington, Wilcox, and Winston.

Highly Rural Counties include Barbour, Bibb, Blount, Bullock, Butler, Cherokee, Choctaw, Clarke, Clay, Cleburne, Coffee, Conecuh, Coosa, Covington, Crenshaw, Cullman, Dallas, DeKalb, Escambia, Fayette, Franklin, Geneva, Greene, Hale, Henry, Jackson, Lamar, Lawrence, Lowndes, Macon, Marengo, Marion, Marshall, Monroe, Perry, Pickens, Pike, Randolph, Sumter, Washington, Wilcox, and Winston.

Moderately Rural Counties include Autauga, Baldwin, Chambers, Chilton, Colbert, Dale, Elmore, Limestone, Russell, St. Clair, Talladega, Tallapoosa and Walker.

Rural North Counties include Bibb, Blount, Chambers, Cherokee, Chilton, Clay, Cleburne, Colbert, Coosa, Cullman, DeKalb, Elmore, Fayette, Franklin, Hale, Jackson, Lamar, Lawrence, Limestone, Macon, Marion, Marshall, Pickens, Randolph, St. Clair, Talladega, Tallapoosa, Walker, and Winston.

Rural South Counties include Autauga, Baldwin, Barbour, Bullock, Butler, Choctaw, Clarke, Coffee, Conecuh, Covington, Crenshaw, Dale, Dallas, Escambia, Geneva, Greene, Henry, Lowndes, Marengo, Monroe, Perry, Pike, Russell, Sumter, Washington, and Wilcox.

Urban Counties include Calhoun, Etowah, Houston, Jefferson, Lauderdale, Lee, Madison, Mobile, Montgomery, Morgan, Shelby, and Tuscaloosa.

Appalachian Region includes Bibb, Blount, Calhoun, Chambers, Cherokee, Chilton, Clay, Cleburne, Colbert, Coosa, Cullman, DeKalb, Elmore, Etowah, Fayette, Franklin, Hale, Jackson, Jefferson, Lamar, Lauderdale, Lawrence, Limestone, Macon, Madison, Marion, Marshall, Morgan, Pickens, Randolph, St. Clair, Shelby, Talladega, Tallapoosa, Tuscaloosa, Walker, and Winston counties.

Delta Region includes Barbour, Bullock, Butler, Choctaw, Clarke, Conecuh, Dallas, Escambia, Greene, Hale, Lowndes, Macon, Marengo, Monroe, Perry, Pickens, Russell, Sumter, Washington, and Wilcox counties.

Data for Counties

# Indicators of Health Status in Alabama 

## MOTOR VEHICLE ACCIDENT MORTALITY

Jointly produced to assist those seeking to improve health care in rural Alabama
by
The Office of Primary Care and Rural Health, Alabama Department of Public Health
and
The Alabama Rural Health Association

Special thanks to the National Organization of State Offices of Rural Health and the National Rural Health Association for funding assistance in the production of this publication.

This and other reports in this series can be referenced on-line by visiting the "Reports" section of the Office of Primary Care and Rural Health Web site at http://adph.org/ruralhealth/ or the "Rural/Urban Comparisons" section of the Alabama Rural Health Association Web site at www.arhaonline.org

July 2008

Indicators of Health Status in Alabama: MOTOR VEHICLE ACCIDENT MORTALITY

- Alabama currently has the $3^{\text {rd }}$ highest motor vehicle accident mortality rate among all 50 states.
- Motor vehicle accidents are the leading cause of death among Hispanics/Latinos in Alabama, accounting for 21.4 percent of all deaths to members of Alabama's Hispanic/Latino population.
- Motor vehicle accidents is the leading cause of death among all Alabamians aged 1 through 39 years. Motor vehicle accidents account for 46.2 percent of all deaths to Alabamians aged 15-19 years and 57.4 percent of all deaths to females in that young age group.
- The 40 Alabama counties with the highest motor vehicle accident mortality rates are all rural counties.

Individuals at risk of death from motor vehicle accidents usually:

- are over age 65 or under age 40.
- are of Hispanic/Latino ethnicity.
- are consuming alcohol while operating a vehicle or ride with a driver who is consuming alcohol.
- have underlying medical conditions which make accidents more hazardous.
- may be on sedative prescription medications which increase the chance of motor vehicle accidents.
- have medical conditions which predispose to an accident.
- operate vehicles that they are not adequately trained to operate.
- ride with those who operate vehicles that they are not adequately trained to operate.
- are operating a vehicle that may not be in safe operating condition.

Individuals at risk for motor vehicle accidents should:

- use available safety devices such as seat belts, harnesses, and child restraints.
- operate vehicles that have safety devices installed and operational.
- make certain that your vehicle is always in safe operating condition.
- complete a qualified driver education course and practice safe driving.
- review medications with physician to reduce or eliminate those which are sedating and substitute non-sedating medications when possible.
- ask a physician to determine if a condition is present which could contribute to the occurrence of a motor vehicle accident and take appropriate corrective measures which may include ceasing to drive an automobile.
- avoid driving or riding with a driver who is consuming alcohol or have a sober designated driver.

## What Is Considered to be Rural In This Publication?

There are several differing definitions for "rural" with most definitions being specific to programs or initiatives. "Rural" is not a concrete term. Opinions on what is considered as rural tend to change between geographical areas and over time. For additional information on what areas are considered as being "rural" for the various federal programs, visit the Rural Assistance Center at http://maps.rupri.org/circ/racrural/amirural.asp where an address can be entered to determine rural status for each program.

This publication considers entire counties as being "rural" or "urban" since most data of interest for studies is available at the county level, but not at sub-county levels. Counties are assigned a score using four major indicators of rurality in this definition. These are population per square mile, the size and number of cities in a county, percentage of total employment comprised by employment in public education, and per capita agricultural sales. For additional information on the determination of which counties are considered "rural," please visit the "What Is Rural?" section at the Alabama Rural Health Association's Web site, www.arhaonline.org.

This publication also presents information on the eight regions established through the Alabama Rural Action Commission, the Black Belt Action Commission, Alabama's Appalachian Region counties, Alabama's Delta Region counties, Alabama's "rural" counties, and Alabama's "urban" counties. In addition, "rural" counties are further classified and presented as being "highly" or "moderately" rural according to their score. "Rural" counties are also classified and presented as being in "rural south" or "rural north" Alabama because of great demographic and health status variation in these portions of the state.

## Counties in the Various Regions or Classifications Used in This Report:

North Alabama Action Commission includes Colbert, Cullman, DeKalb, Franklin, Jackson, Lauderdale, Lawrence, Limestone, Madison, Marion, Marshall, Morgan, and Winston.

West Alabama Action Commission includes Bibb, Fayette, Greene, Hale, Lamar, Pickens, and Tuscaloosa.
Central Alabama Action Commission includes Blount, Chilton, Jefferson, St. Clair, Shelby, and Walker.
East Alabama Action Commission includes Calhoun, Chambers, Cherokee, Clay, Cleburne, Coosa, Etowah, Randolph, Talladega, and Tallapoosa.

South Central Alabama Action Commission includes Autauga, Bullock, Butler, Crenshaw, Elmore, Lee, Lowndes, Macon, Montgomery, Pike, and Russell.

Tombigbee Action Commission includes Choctaw, Clarke, Conecuh, Dallas, Marengo, Monroe, Perry, Sumter, Washington, and Wilcox.

Wiregrass Action Commission includes Barbour, Coffee, Covington, Dale, Geneva, Henry, and Houston.
Southwest Alabama Action Commission includes Baldwin, Escambia, and Mobile.
Black Belt Action Commission includes Bullock, Choctaw, Dallas, Greene, Hale, Lowndes, Macon, Marengo, Perry, Pickens, Sumter, and Wilcox counties.

Rural Counties include Autauga, Baldwin, Barbour, Bibb, Blount, Bullock, Butler, Chambers, Cherokee, Chilton, Choctaw, Clarke, Clay, Cleburne, Coffee, Colbert, Conecuh, Coosa, Covington, Crenshaw, Cullman, Dale, Dallas, DeKalb, Elmore, Escambia, Fayette, Franklin, Geneva, Greene, Hale, Henry, Jackson, Lamar, Lawrence, Limestone, Lowndes, Macon, Marengo, Marion, Marshall, Monroe, Perry, Pickens, Pike, Randolph, Russell, St. Clair, Sumter, Talladega, Tallapoosa, Walker, Washington, Wilcox, and Winston.

Highly Rural Counties include Barbour, Bibb, Blount, Bullock, Butler, Cherokee, Choctaw, Clarke, Clay, Cleburne, Coffee, Conecuh, Coosa, Covington, Crenshaw, Cullman, Dallas, DeKalb, Escambia, Fayette, Franklin, Geneva, Greene, Hale, Henry, Jackson, Lamar, Lawrence, Lowndes, Macon, Marengo, Marion, Marshall, Monroe, Perry, Pickens, Pike, Randolph, Sumter, Washington, Wilcox, and Winston.

Moderately Rural Counties include Autauga, Baldwin, Chambers, Chilton, Colbert, Dale, Elmore, Limestone, Russell, St. Clair, Talladega, Tallapoosa and Walker.

Rural North Counties include Bibb, Blount, Chambers, Cherokee, Chilton, Clay, Cleburne, Colbert, Coosa, Cullman, DeKalb, Elmore, Fayette, Franklin, Hale, Jackson, Lamar, Lawrence, Limestone, Macon, Marion, Marshall, Pickens, Randolph, St. Clair, Talladega, Tallapoosa, Walker, and Winston.

Rural South Counties include Autauga, Baldwin, Barbour, Bullock, Butler, Choctaw, Clarke, Coffee, Conecuh, Covington, Crenshaw, Dale, Dallas, Escambia, Geneva, Greene, Henry, Lowndes, Marengo, Monroe, Perry, Pike, Russell, Sumter, Washington, and Wilcox.

Urban Counties include Calhoun, Etowah, Houston, Jefferson, Lauderdale, Lee, Madison, Mobile, Montgomery, Morgan, Shelby, and Tuscaloosa.

Appalachian Region includes Bibb, Blount, Calhoun, Chambers, Cherokee, Chilton, Clay, Cleburne, Colbert, Coosa, Cullman, DeKalb, Elmore, Etowah, Fayette, Franklin, Hale, Jackson, Jefferson, Lamar, Lauderdale, Lawrence, Limestone, Macon, Madison, Marion, Marshall, Morgan, Pickens, Randolph, St. Clair, Shelby, Talladega, Tallapoosa, Tuscaloosa, Walker, and Winston counties.

Delta Region includes Barbour, Bullock, Butler, Choctaw, Clarke, Conecuh, Dallas, Escambia, Greene, Hale, Lowndes, Macon, Marengo, Monroe, Perry, Pickens, Russell, Sumter, Washington, and Wilcox counties.

Motor Vehicle Accident Mortality and Mortality Rates
U.S. and Selected Alabama Areas, 2004 - 2006

| Area | Is County Rural? | Deaths | Rate Per 100,000 |
| :--- | :---: | :---: | :---: |

## SECTION 4:

## Resources for finding health-related data

The community health resource guide can be used as a helpful resource when writing grants or identifying baseline data for health care programs. Many of the major sources of health-related data are listed.
Major Sources of Diverse Data ..... 79
Research Centers ..... 79
Health ..... 80

## Research Centers

## Center for Business and Economic Research Alabama State Data Center <br> cber.cba.ua.edu/data.htmI

The Center for Business and Economic Research at the University of Alabama features information on Alabama indicators including population estimates and projections, income, poverty and employment. A unique feature of this website is the section on Alabama maps. You can download demographic profiles, census block, and census track information on the maps.

## Economic Development Partnership (EDPA)

www.edpa.org
The EDPA is a private, non-profit organization supported by leading businesses in Alabama dedicated to the state's long-term economic growth. EDPA provides a community data section that includes community profiles, metro area profiles and county profiles. It also has a quality of life section and a map section.

## FedStats

www.fedstats.gov
Fedstats is a portal that makes statistics from more than 100 agencies available to citizens. Health topics include diseases, family and social environment, child health, WIC and nutrition. Statistical profiles are available for states, counties, cities and congressional districts.

## State of the Cities Data System

U. S. Department of Housing and Urban Development
socds.huduser.org
This site maintains current information on housing needs, market conditions, FBI crime data, census data, priority housing and community development issues. Although not directly health-related, this site can provide some community information that may be needed in a grant proposal. State of the Cities reports are also available through this website.

## Statistical Abstract of the United States

U.S. Census Bureau
wWw.census.gov
This very comprehensive website has information and data on hundreds of topics. It is marketed as the source for population, housing, economic and geographic data. The easiest way to find information on this site is by clicking on the "Subjects $A-Z$ " button.

## United Nations Statistics

unstats.un.org/unsd/databases.htm
This website provides a global center for data. Most of the health-related data on this site is included in the following sections-Demographic Yearbook, Population and Vital Statistics, and Social Indicators.

This site not only has detailed employment and wage data but it also has a census of fatal occupational injuries. You can access this information by selecting "occupations" and then selecting "injuries, illnesses and fatalities" then select "current injury, illness and fatality data," then select "fatal injuries - 2006 data now available" then select "state data." This gives detailed current and archived data on work-related injuries, illnesses, and fatalities.

## Health

Alabama Department of Public Health (ADPH)
www.adph.org
This website offers information on a variety of health topics. We have highlighted four areas of this website that are particularly useful when writing grants focused on rural health, AIDS/HIV or cancer. However, we recommend using the "Contents A-Z" button at the top of the page for more health topics.

## - AIDS/HIV Data - ADPH

www.adph.org/aids
This section of the ADPH website provides statistics on AIDS/HIV incidence prevalence and cumulative cases on the statewide and county level. Statistics are presented by race/ethnicity, gender, age at diagnosis and exposure. Reports and articles relating to AIDS/HIV are also available on this website.

## - Cancer Registry Data - ADPH

www.adph.org/cancer_registry
The cancer registry reports all cancer cases diagnosed or treated in Alabama. Trends in cancer cases and county cancer profiles are available through this website.

- Center for Health Statistics - ADPH
www.adph.org/healthstats
This is the Alabama Center for Health Statistics. A wealth of health-related facts and data is available through this site. An "A-Z Index" is offered and is the quickest way to search for a topic through this resource.

## - Office of Primary Care and Rural Health - ADPH www.adph.org/ruralhealth

Specific reports and data on rural health issues are available through this website including health status indicator reports and mortality reports.

## Alabama County Status of Primary Healthcare Reports Alabama Medical Education Consortium

www.amec.uwa.edu
The Alabama Medical Education Consortium developed the Status of Primary Healthcare Reports in selected rural counties. A list of 28 county reports are available for download with additional reports being compiled. These reports are very comprehensive covering all health care facilities operating and all primary care providers practicing in selected counties.

This website covers the various social assistance programs available in Alabama. There is detailed monthly statistical reporting for DHR services as well as annual progress and services reports.

Alabama Medicaid Program Data
www.medicaid.state.al.us
This site offers an "A-Z Index" of topics that include various health care issues related to the State's Medicaid Program.

This site offers information on "What is rural?" including definitions and Alabama counties, health-related acronyms, links to on-line statistics/data sources, and publications related to rural health issues. Special topics addressing rural health are also included.

This website offers health care data reports but they are "for sale" only. These reports include hospital data, nursing home data, home health care data and hospital patient origin data.

## Centers for Disease Control and Prevention (CDC)

www.cdc.gov/DataStatistics
This is a major on-line source for health information. This website is so large and houses so much data that it can overwhelm the first time user. In order to simplify your search, please check out the following areas of the CDC website.

The data section of the CDC website offers several interactive tools and data reports. It also has a wonderful index organized by health topics. You can access this section of the CDC site at www.cdc.gov/datastatistics.

- Behavioral Risk Factor Surveillance
apps.nccd.cdc.gov/brfss, System - CDC apps.nccd.cdc.gov/BRFSS-SMART

The CDC has a behavioral risk factor surveillance system where health risk data can be found. Risk data for Birmingham, Mobile, Montgomery and Tuscaloosa metropolitan statistical areas is available at http://apps.nccd.cdc.gov/BRFSS-SMART. State and national health risk data can also be found at http://apps.nccd.cdc.gov/brfss.

- CDC Wonder - CDC

CDC Wonder is an interactive section that has the capability to retrieve health data from numerous national databases. The "A-Z Index" tab allows access to a wide variety of public reports and data systems organized by name.

The National Center for Health Statistics is an excellent source of vital statistics and other health-related data.

- Youth Risk Behavior Surveillance System - CDC
www.cdc.gov/HealthyYouth/States/index.htm
For those users needing data on youth risk behavior, the CDC has a section on the website called the Youth Risk Behavior Surveillance System. You can access this information which includes unintentional injury and violence, tobacco use, alcohol and other drug use, sexual behavior, dietary behavior, and physical activity.

National Institute for Mental Health

## www.nimh.nih.gov/health/statistics/index.shtmI

The National Institute for Mental Health reduces the burden of mental illness behavior disorders through research on the mind, brain and behavior. The section on NIMH News and Statistics offers resources on mental health topics and statistics on mental health disorders. There is also a topic finder available on this website.

Rural Assistance Center
www.raconline.org
This excellent resource serves as the most complete portal for identifying and gaining access to rural health-related data on the internet. In addition to a state resource section, the rural assistance center offers information guides on a variety of rural health-related topics. An extremely comprehensive section on funding opportunities is also available.
U. S. Centers for Medicare and Medicaid Services www.cms.hhs.gov/home/rsds.asp

This site offers resources addressing Medicaid and Medicare program utilization. There is a section on acronyms as well as research, statistics, data and systems. A resource section is also available on this website.

World Health Organization Health-Related Data
www.who.int/research/en
Included in this site is the Global Health Atlas, regional health-related statistics and the WHO Statistical Information System. The WHO Statistical Information System includes 70 different health-related indicators.

For further information or technical assistance requests, please call (334) 206-5436.
